Instant64-Serie

What dns functionality providing me inclusive domains in the Instant64 series?

Via the customer center the contained inclusive domains in the dedicated server series "Instant64" can be edited with own dns entries.

By default, the domains are connected up to our webserver IP.

In the dns management "IN A - Entries" this IP assisgnment can be changed and for example the IP address of the dedicated server can be directly registered.

Furthermore possible are own MX-entries on the own server. Therefore this server can be work directly as a mail server. (a correctly configuration is provided)
