PHP und mySQL

Which requirements are needed for a successful Wordpress - installation on a shared hosting plan?

Blog- and CMS-Software "Wordpress" needs more memory for execution its lot of functions. If you want to install successful a WordPress standard installation it is a minimum of 64MB needed for PHP-variable "memory_limit".

Please pay attention during your order of a shared hosting plan. If there is less memory system will not work correctly due of memory errors. Normal usage is not possible in this case.
